

# SHAPE

---

**A 2-DIMENSIONAL AREA CREATED BY THE 2 ENDS OF A LINE JOINING TO ENCLOSE AN AREA**

**SHAPES ARE EITHER GEOMETRIC OR ORGANIC/FREE-FORM.**

**Geometric**: can be described using mathematical terms;  
they are very regular and precise;  
often found in man-made items because they are easier to make;  
examples: circle, square, triangle, star, oval, hexagon, etc.

**Organic**: are difficult to describe using definitions;  
are irregular or uneven;  
are more often found in nature;  
examples: clouds, puddle, tree, rock, etc.
